No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

The nonapeptide can be used in a vaccine to treat a cancerous condition involving HLA-Al subtype cancerous cells. The nucleic acid encoding the nonapeptide can be used as a probe to identify tumour cells. This sequence is homologous to the peptide described and is encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 20; 33pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nona:peptide derived from tumour rejection antigen precursor - presented by HLA-Al cancer cells, for use in diagnosis or therapy of esp. melanoma and breast cancer.
                                                                                                             R99343-R99350 represent MAGE nonapeptides, based on the tumour rejection antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention (see R99337-R99342),
                                                                                                                                                                                                                                                                               New nona:peptide(s) that bind
by specific cytolytic T cells,
tumours and to expand T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-FEB-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HLA binding peptide; cell lysis; cytolytic T cell; MAGE family; human; tumour rejection antigen precursor; TRA; MAGE-1; tumour; cancer cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   R99345;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptides can also be used therapeutically, to induce a CTL response to tumours (where the peptides are optionally coupled to tumour-specific antibodies), or to induce a response by CTLs that are otherwise inactive. The peptide sequences may also be used to expand specific CTLs in vitro for later return to the patient, such as for treating melanoma. Tumour cells can be identified by using DNA encoding the nonapeptides as probes. Non-human cells transformed with the HLA-Al gene and a DNA sequence encoding one of the peptides, can be used to generate CTLs, or to detect the presence of CTLs in human samples. The non-human transformed cells, when polytransformed, are universal effector cells, and can be used in vaccines, or for treating melanoma or breast cancer.
                     Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and

      This peptide is a tumour rejection antigen presented by a HLA-B44 molecule and derived from a MACE-12 tumour rejection antigen precursor (TRAP). Claimed tumour rejection antigens (W23038-4) are able to bind to HLA-B44 positive cells, making them useful in identifying cells which present HLA-B44 molecules on their surfaces for use in the diagnosis and therapy of cellular abnormalities. The complex of the tumour rejection antigen and HLA molecule provokes a cytolytic T cell response. The tumour rejection antigens, or complexes of tumour rejection antigens and HLA-B44, can be used as vaccines to treat disorders characterised by expression of the TRAP molecule such as cancer, especially melanoma. Vaccines can also be prepared from cells which present the tumour rejection antigens and several from cells which present the tumour rejection antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a partient. The polynuclectides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                     Tumour rejection antigens presented by molecules - useful to identify HLA-B44 and therapy of cellular abnormalities

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8 X C C
                                     The present sequence represents in-chain hydroxylase CYP81B1 of Jerusalem artichoke. CYP81B1 is a microsomal cytochrome P450 that catalyses the omega-2, omega-3 and omega-4 hydroxylation of capric, lauric and myristic acids. The major metabolite is the comega-3-hydroxylated compound. The invention provides isolated nucleic acids (see x58400-06) encoding plant fatty acid hydroxylases (see v05896-902). Also claimed are host cells, transgenic plants and compositions consisting of the plant fatty acid hydroxylase, a process for isolating additional fatty acid hydroxylase genes from a plant, and a process of altering the fatty acid composition in a plant by expressing the plant fatty acid hydroxylase in a transgenic plant. Manipulating or epoxidating a fatty acid composition in a plant by expressing the plant fatty acid acid composition in a plant by expressing the plant fatty acid acid composition in a plant by expressing the plant fatty acid acid composition in a plant by expressing the plant fatty acid acid composition in a plant by expressing the plant fatty acid acid composition in a plant by expressing the plant fatty acid acid content of plants will modify resistance to drought and cattack by insects and other pests. The transgenic plants may also be used as sources of hydroxylated and epoxidized fatty acids useful in the manufacture of e.g. lubricants, anti-slip agents,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                              Y34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see X91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see Y34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                   Genome sequence of Chlamydia pneumoniae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a transporter system for delivering CC nucleic acid to a cell. The system comprises a nucleic acid binding CC complex, consisting of a binding molecule bonded non-covalently to the CC mucleic acid, and covalently to a surface ligand, and a lytic agent. The CC binding molecule is spermine or a spermidine derivative. Nucleotide Sequences A3663-A3652 and peptide sequences Y94850 are used in the construction of the transporter system of the invention. The CC transporter system is used in gene therapy, particularly to deliver CC uncleic acids to hepatocytes, muscle cells or bone forming cells, e.g for CC treating cardiovascular disease, cancer, and infection. The transporter CC systems are also used to create transgenic animals (as models for human CC arcinogenesis or disease or for drug testing). Other uses include CC transforming cells to produce proteins, or transferting cells in vitro CC to study the function of the nucleic acid. The use of a surface ligand CC allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a nucleic acid transport system (NTS) for Cd delivering nucleic acid into a cell. The NTS contains but is not limited Ct to 5 components: (a) the nucleic acid or a macromolecule to be delivered; CC (b) a molety that recognizes and binds to a cell surface receptor or C antigen or is capable of entering a cell through cytosis; (c) a nucleic acid or macromolecular molecule binding molety; (d) a molety that is CC capable of moving or initiating movement through a nuclear membrane; and/CC or (e) a lysis molety that enables the transport of the entire complex CC from the cell surface directly into the cytoplasm of the cell. The NTS CC delivers nucleic acid into the cellular interior as well as the nucleus CC of specific cells. The NTS can be used to treat disorders by targeting specific animals for assessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The CC systs agent within the NTS avoids the problem of endosomal/lysosomal

This invention describes a novel system (I) for delivering a nucleic acid CC to a cell, comprising a binding complex comprising a ligand binding CC molecule noncovalently bound to a nucleic acid and covalently linked to a CC surface ligand, and a second binding complex comprising a second binding CC molecule noncovalently bound to a nucleic acid and covalently linked to a covalent ligand. The complexes are simultaneously bound to the nucleic CC acid. The nucleic acid transporter system can also be used in a method CC for the in vivo targeting of the insertion of DNA into a cell. It can CC also be used in processes for producing transformed cell lines. The CC system can be used to deliver a variety or proteins and polypeptides, CC such as hormones, growth factors, enzymes, clotting factors, tumor complexesors, viral antigens, drugs, oncogenes, tumor antigens, tumor acceptors wirely system uses lysis agents to overcome the problems of CC endosomal/lysosomal degradation seen with prior art systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

from a cDNA library prepd. from RNA extd. from fibroblast IMR-90 cells (ATCC CCL-186). The N-terminal of the alpha chain is unclear. The sequence shows homology to bHGF except between AAS 162 and 166 of this sequence which is absent from the TCF-II sequence. The DNA can be used to produce the TCF-II by recombinant pank trophology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA technology. TCF II is an anticancer agent and induces differentiation of leukaemia cells, enhances cell-mediated immunity, and accelerates the proliferation of human blood vessel endothelial cells and hepatic parenchymal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human glycoprotein having antitumour activity - for inducing differentiation of leukaemia cells and enhancing cell mediated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The amino acid sequence is that of a plasminogen-like growth factor (PGLF) protein. It can be isolated from conditioned medium of human embryonic lung fibroblasts. The DNA encoding PGLF can be obtd. from a DNA library of M246 human embryonic lung fibroblasts. The sequence may be used in the determn. of the level of mRNA transcripts encoding the protein which may be useful in the diagnosis of malignancy. The amino acid sequence shown here is that given in the specification, it differs from the expected translation of the PGLF gene at amino acids 175 - Pro, which
The sequence was deduced from a portion of HLC3, one of two clones, (for HLC2 see R15623) isolated from a cDNA library prepd. from mRNA extracted from human leukocytes. HLC2 has almost the same sequence as HLC3 except for five residues (162-166) in HLC2 which do not appear in HLC3. HLC3 shows similar characteristics to the human liver-derived HGF identified in Nature, 342, 440, 1989, but differs at 14 positions in the amino acid sequence. The DNA sequence can be expressed and the resulting protein, recombinant HGF, used in hepatocyte research, esp. into the mechanism of hepatoma, and to prepare anti-HGF antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure;

                                                                                                                                                                                                                                                                            Shima N,
Tsuda E;
                                                                                                          A human foetal lung fibroblast library was screened with a synthetic probe coding for the N-terminal sequence of TCF-II. A cDNA clone was isolated and sequenced. The coding sequence can be incorporated into a plasmid and transformed into a microorganism for production of TCF-II. The protein itself can be used as a liver cell growth factor or a tumour cell killing factor. See also Q21067-9.

It has physiological activity, and using it enhanced growth of hepatocytes is possible. It is useful as a clinical diagnostic reagent, or a drug for treating hepatic disease.

C. :FUNCTION: DNA GYRASE NEGATIVELY SUPERCOILS CLOSED CIRCULAR DOUBLE-CIRCULAR DOUBLE-CIRCULAR DOUBLE-STRANDED DNA IN AN ATP-DEPENDENT MANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED CONTROL ISOMERS OF DOUBLE-STRANDED DNA RINGS, INCLUDING CATENANES AND KNOTTED RINGS.

C. -- CATALYTIC ACTIVITY: ATP-DEPENDENT BREAKAGE, PASSAGE AND REJOINING OF DOUBLE-STRANDED DNA.

C. -- SUBUNIT: MADE UP OF TWO CHAINS. THE A CHAIN IS RESPONSIBLE FOR DNA BREAKAGE AND REJOINING; THE B CHAIN CATALYZES ATP HYDROLYSIS. THE ENGYME FORMS AN A2B2 TETRAMER.

C. -- SIMILABITY: BELONGS TO TYPE II TOPOISOMERASE FAMILY.

PATHMAY: PHOSPHOLIFID BIOSYNTHESIS.

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

TISSUE SPECIFICITY: ROOTS AND SINK LEAVES.

SIMILARITY: BELONGS TO THE CDS FAMILY.
PROGRESSION. ANTIGEN RECOGNIZED ON A MELANOMA BY AUTOLOG CYTOLYTIC T LYMPHOCYTES.
TISSUE SPECIFICITY: EXPESSED IN MANY TUMORS OF SEVERAL SUCH AS MELANOMA, HEAD AND NECK SQUAMOUS CELL CARCINOMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IIYMGHLYI

R99343-R99350 represent MAGE nonapeptides, based on the tumour rejection antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention (see R99337-R99342), which bind to a HIA molecule on a cell, and provoke lysis by cytolytic T cells (CTLs) specific for a complex of the HIA molecule and nonapeptide. The nonapeptides can be used diagnostically to identify tumours expressing a particular HIA molecule, or to identify cancer cells. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An isolated nonapeptide having the amino acid sequence Glu-Val-Asp-
pro-Ile-Gly-His-Leu-Tyr is derived from the tumour rejection antigen
precursor encoded by the MAGE-3 gene and presented by HIA-Al. The
nonapeptide can be used in a vaccine to treat a cancerous condition
involving HIA-Al subtype cancerous cells. The nucleic acid encoding
the nonapeptide can be used as a probe to identify tumour cells.

This sequence is homologous to the peptide described and is encoded
                                                                                                                                                                                                                                                                                                                                    New nona:peptide(s) that bind to HLA molecule(s) by specific cytolytic T cells, for diagnosis and tumours and to expand T cells in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-FEB-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        W09626214-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            peptides can also be used therapeutically, to induce a CTL response to tumours (where the peptides are optionally coupled to tumour-specific antibodies), or to induce a response by CTLs that are otherwise inactive. The peptide sequences may also be used to expand specific CTLs in vitro for later return to the patient, such as for treating melanoma. Tumour cells can be identified by using DNA encoding the nonapeptides as probes. Non-human cells transformed with the HLA-Al gene and a DNA sequence encoding one of the peptides, can be used to generate CTLs, or to detect the presence of CTLs in human samples. The non-human transformed cells, when polytransformed, are universal effector cells, and can be used in vaccines, or for treating melanoma or breast cancer.
                                        Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and
are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to tre
                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
This peptide is a tumour rejection antigen presented by a HLA-B44 molecule and derived from a MAGE-12 tumour rejection antigen precursor (TRAP). Claimed tumour rejection antigens (W2308-43) are able to bind to HLA-B44 positive cells, making them useful in identifying cells which present HLA-B44 molecules on their surfaces for use in the diagnosis and therapy of cellular abnormalities. The complex of the tumour rejection antigen and HLA molecule provokes a cytolytic T cell response. The tumour rejection antigens and HLA-B44, can be used as vaccines to treat disorders characterised by expression of the TRAP molecule such as cancer, especially melanoma. Vaccines can also be prepared from cells which present the tumour rejection antigens and answer the tumour rejection antigens are such as cancer.
                                                                                                                                                                                                                                                Tumour rejection antigens presented by molecules - useful to identify HLA-B44 and therapy of cellular abnormalities

CC Y45390 to Y48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell CC response against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC Individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also CC useful diagnostically, and can be used to induce a cytotoxic T cell cresponse, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. A; Description: stimulates mitosis of hepatocytes and other cells
A; Note: does not have proteinase activity
C; Superfamily: hepatocyte growth factor; kringle homology; trypsin homology
C; Keywords: alternative splicing; glycoprotein; growth factor; heterodimer; kringle; pyr
F; 131/Domain: signal sequence #status predicted <SIG>
F; 32-494,495-728/Product: hepatocyte growth factor #status experimental <MAT>
F; 32-494/Domain: kringle homology <KR1>
F; 128-206/Domain: kringle homology <KR2>
F; 211-288/Domain: kringle homology <KR2>
F; 395-383/Domain: kringle homology <KR3>
F; 391-469/Domain: kringle homology <KR4>
F; 391-469/Domain: kringle homology <KR4>
F; 395-718/Domain: trypsin homology <KR4>
F; 495-718/Domain: trypsin homology <KR4>
F; 397-4004ified site: pyrrolidone carboxylic acid (Gln) (in mature form) #status experiment F; 397-402,566,653/Binding site: carboxylic acid (Gln) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Molecule type: mRNA
